

Real-Time Monitoring Pipeline

Live safety review of AI psychiatric companion conversations (hpms-dashboard)

1. Upstream sources (external to dashboard)

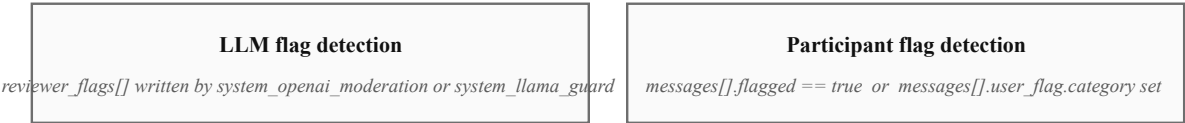

2. Shared database

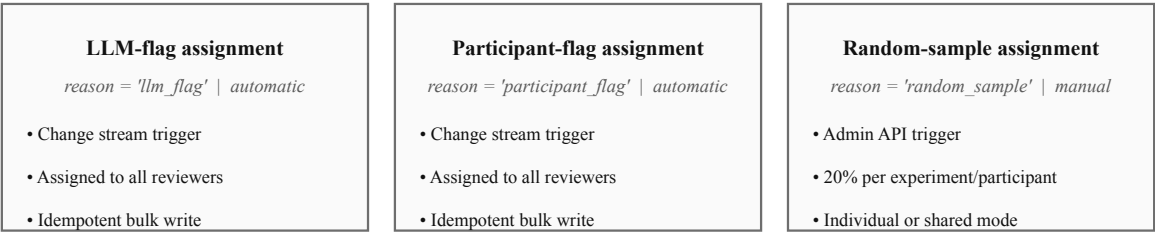

3. Real-time change detection

MongoDB change stream watches Conversations collection; 'opened_by' updates are filtered to prevent refresh loops

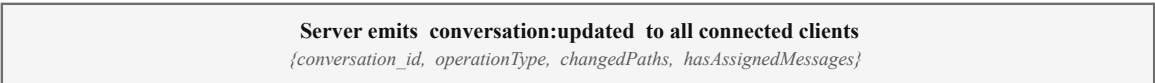

4. Reviewer assignment engine

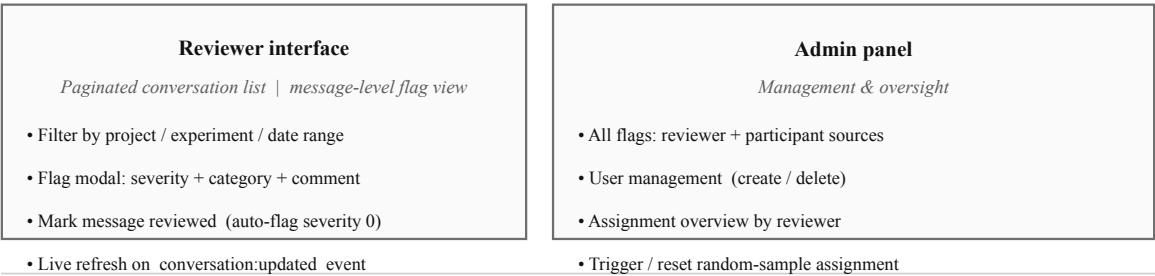

Messages may carry multiple reasons simultaneously; reviewer view deduplicates by message index

5. Real-time push (Socket.io)

6. Review dashboard (React 18 + Express REST API)

Deployment: Docker Compose (local dev) | Helm -> Kubernetes, project namespace (production) | CI/CD: GitHub Actions -> GitLab image registry
Branch strategy: dev -> dev environment | main -> production | Auth: JWT (jsonwebtoken) + bcrypt password hashing
